4. Circuit Description

4-1 Logic Section

4-1-1 Power Supply

With the battery installed on the phone and by pressing the PWR key, the VBATT and ON_SW signals will be connected. This will turn on Q109(2SC4081) and make gate port Low. VBAT will be supplied to input if DC/DC converter, controlled by Q115, makes 3.6V for Idle and Talk Mode, and 3.4V for Sleep Mode.

The VBAT applied to ON_SW turns on Q110(DTC144) and will result in the signal ON_SW_SENSE to change state from HIGH to LOW. The MSM recognizes this signal and sends out PS_HOLD(logical HIGH) to turn on Q109 even after the PWR key is released.

The power from U108 is used in the digital part of MSM and BBA. The power from U111 is used in the analog part of BBA.

4-1-2 Logic Part

The Logic part consists of internal CPU of MSM, RAM, ROM and EEPROM. The MSM receives TCXO/4 and CHIPX8 clock signals from the BBA and controls the phone. The major components are as follows:

- ¶UCPU : INTEL 80186 core
- ¶UFROM : U111,U114 (MBM29LV800T)-8MBIT FLASH ROM

The MSM outputs 2.048MHz PCM_CLK (pin19) and 8KHz CODEC_SYNC (pin16,20) to the CODEC (U102). The voice PCM data from the MSM (U101)PCM_DIN (pin135) is compressed into 8KHz by QCELP algorithm in the CDMA mode.

RF Interface

TX : TX_AGC_ADJ (pin35) port is used to control the TX power level and PA_ON (pin44) signal is used to control the power amplifier.

RX : AGC_REF (pin36) port is used to control the RX gain and TRK_LO_ADJ (pin45) is used to compensate the TCXO clock.

General Purpose I/O Register Pins

Power Down Control

When the IDLE/signal turns LOW, only the TX sections will be disabled. If both the IDLE/ and SLEEP/ changed to LOW, all the pins except for the TXCO are disabled.

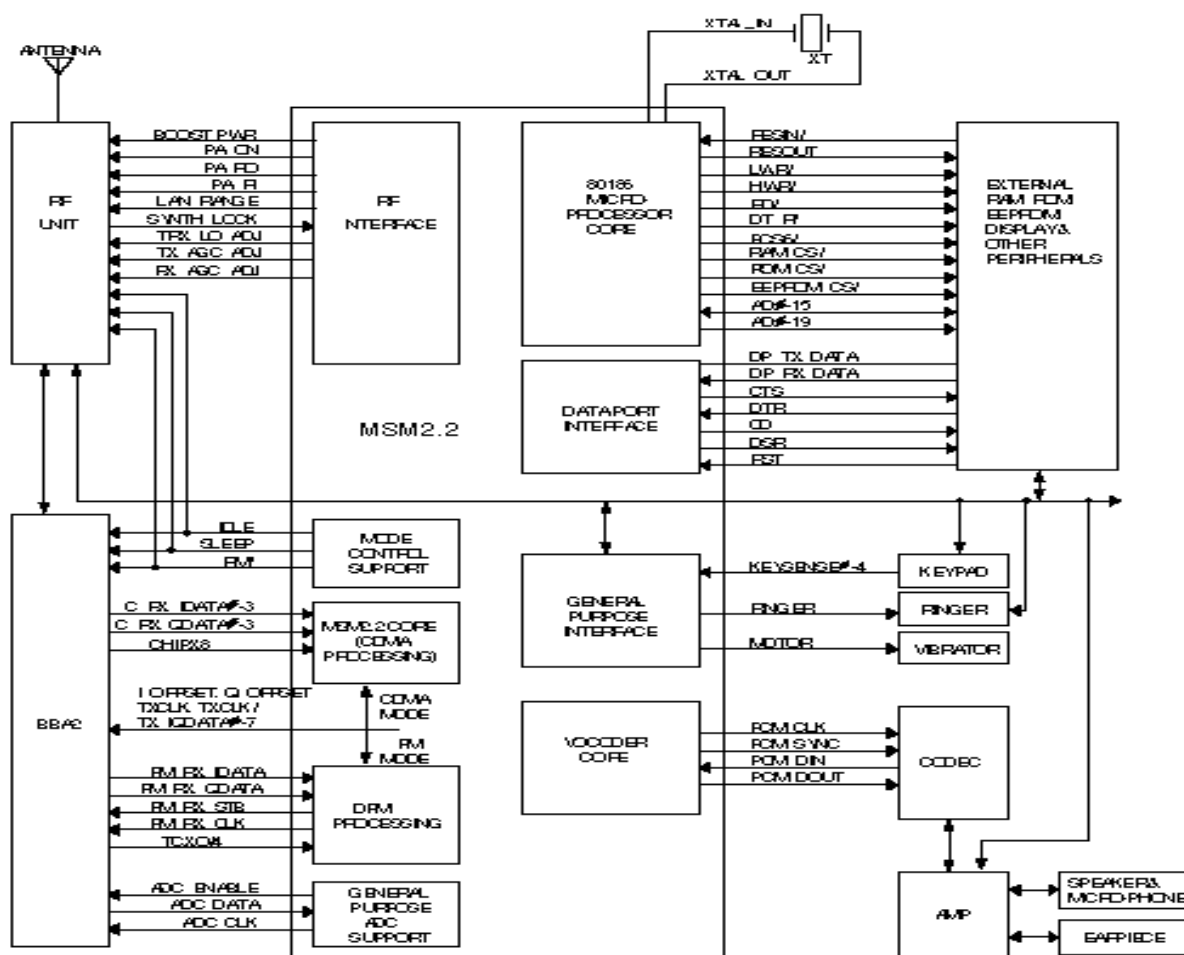

Figure 4-1 Baseband Block Diagram

4-1-4 Audio Section

TX AUDIO PATH

The voice signal output from microphone is filtered and amplified by the internal OP-AMP and is converted to PCM data by the CODEC(U102). This signal is then applied to the MSM(U101)'s internal vocoder.

RX AUDIO PATH

The PCM data out from the MSM is converted to audio signal by ADC of CODEC(U102), is then amplified by the speaker amplifier(U105) to be sent to the speaker unit.

VOLUME ADJUST

Volume can be adjusted up to 8 steps for the user to obtain a proper loudness of received signal.

4-1-5 Buzzer Driving Circuitry

Buzzer generates alert tone. When the buzzer receives the timer signal from the MSM, it generates alert tone. The buzzer level is adjusted by the alert signal's period generated from the MSM timer.

4-1-6 Key Tone Generator

Ring signal (pin49) from MSM(U101) is passed through LPF consisting of R220, C222, R219, and C221, amplified at the speaker amp(U105) and come out to speaker.

4-2 Receiver Section

LOW NOISE AMPLIFIER (LNA)

The low noise amplifier featuring 1.6dB Noise Figure and 19dB gain amplifies a weak signal received from the base station to obtain the optimum signal level.

DOWN CONVERTER (MIXER)

First local signal is applied to this down converter. The down converter transfers the signal amplified at the LNA into 210.38 MHz IF signal. 210.38MHz IF signal is made by subtracting 1960 \pm 30MHz RF signal from 1750 \pm 30MHz first local signal. The LNA is Q303 and down converter is U302.

RF IF AUTOMATIC GAIN CONTROLLER (AGC) AMP

210.38 MHz IF signal is applied to IF AGC amp, the AGC output level is applied to BBA (Base Band Asic). The AGC amp (U303) keeps the signal at a constant level by controlling the gain. Dynamic range is 90dB, up gain +45dB, and down gain -45dB.

RF BAND PASS FILTER (BPF)

PHASE LOCKED LOOP (PLL)

Input reference frequency is generated at VCTCXO (U306) and the signal is generated at VCO. PLL compares the two signals and generate the desired signal with a pre-programmed counter which controls voltage.
