CAUTION

CAUTION

MICROWAVE RADIATION

DO NOT BECOME EXPOSED TO RADIATION FROM THE MICROWAVE GENERATOR OR OTHER PARTS THAT CONDUCT MICROWAVE ENERGY.

GENERAL IMPORTANT INFORMATIONS

This Manual has been prepared to provide Service Engineers with Operation and Service Information. It is recommended that service engineers carefully study the entire text of this manual, so they will be qualified to render satisfactory customer service.

WARNING

Note: The parts marked "*" are used at voltage more than 250V. (Schematic Diagrams).

WARNING

Never operate the oven until the following points are ensured.

- (A) The door is tightly closed.
- (B) The door and oven hinges are not defective.
- (C) The door packing is not damaged.
- (D) The door is not deformed or warped.
- (E) There is not any other visible damage with the oven.

Servicing and repair work must be carried out only by trained Service Engineers.

All the parts marked "*" on schematic diagrams are used at voltages more than 250V.

Removal of the outer wrap gives access to potentials above 250V.

If the Magnetron or/and the door assembly are damaged, loosened or removed may cause undue microwave exposure.

SERVICING

WARNING TO SERVICE PERSONNEL

Microwave ovens contain circuitry capable of producing very high voltage and current. Contact with the following parts will result in electrocution
High voltage capacitor, High Voltage transformer, Magnetron, High voltage rectifier assembly, High voltage wires.

REMEMBER TO CHECK 3D

- 1) Disconnect the supply.
- 2) Door opened, and wedged open.
- 3) Discharge high voltage capacitor.

WARNING AGAINST THE CHARGE OF THE HIGH VOLTAGE CAPACITOR

The high-voltage capacitor remains charged about 60seconds after the oven has been switched off. Wait for 60 seconds and then short-circuit the connection of the high-voltage capacitor (that is, of the connecting lead of the high-voltage rectifier) against the chassis with the use of an insulated screwdriver.

It is recommended that wherever possible fault-finding is carried out with the supply disconnected. It may in, some cases, be necessary to connect the supply after the outer case has been removed, in this event carry out 3D checks and then disconnect the leads to the primary of the power transformer. Ensure that these leads remain isolated from other components and the oven chassis. (Use insulation tape if necessary.) When the testing is completed carry out 3D checks and reconnect the leads to the primary of the power transformer.

REMEMBER TO CHECK 4R

- 1) Reconnect all leads removed from components during testing.
- 2) Replace the outer case (cabinet).
- 3) Reconnect the supply.
- 4) Run the oven. Check all functions.

Microwave ovens should not be run empty. To test for the presence of microwave energy within a cavity, place a cup of cold water on the oven turntable, close the door and set the power to HIGH and set the microwave timer for two (2) minutes. When the two minutes has elapsed (timer at zero) carefully check that the water is now hot. If the water remains cold carry out 3D checks and re-examine the connections to the component being tested.

When all service work is completed, and the oven is fully assembled, the microwave power output should be checked and a microwave leakage test carried out.

When troubleshooting the microwave oven, it is helpful to follow the Sequence of Operation in performing the checks. Many of the possible causes of trouble will require that a specific test be performed. These tests are given a procedure letter which will be found in the "Test Procedure" section.

IMPORTANT: If the oven becomes inoperative because of a blown fuse F1 in the monitored latch switch - monitor switch - circuit, check the monitored latch switch and monitor switch and before replacing the fuse F1.

GENERAL INFORMATION

WARNING THIS APPLIANCE MUST BE EARTHED

IMPORTANT

THE WIRES IN THIS MAINS LEAD ARE COLOURED IN ACCORDANCE WITH THE FOLLOWING CODE:

GREEN-AND-YELLOW	: EARTH
BLUE	: NEUTRAL
BROWN	: LIVE

PRODUCT SPECIFICATIONS

SPECIFICATION

ITEM	DESCRIPTION		
Power Requirements	230 Volts / 50 Hertz / Single phase, 3 wire earthed		
Power Consumption	Microwave cooking 1.5kW Approx. 6.7A		
	Convection cooking 2.7kW Approx.12A		
	Grill cooking 2.7kW Approx.12A		
	Dual cooking Micro and Grill 2.8 kW Approx. 12.7 A Micro and Convection 2.8 kW Approx. 12.7 A		
Power Output	900W watts nominal of RF microwave energy (measured by way of IEC 60705) Operating frequency of 2450 MHz		
Grill heating element Power Output	1300 W (650 W x 2)		
Convection heating element Power Output	1450 W		
Case Dimensions	Width 550mm Height 368mm Depth 537mm

OPERATION SEQUENCE

OFF CONDITION

Closing the door activates the monitored latch switch and the stop switch.

IMPORTANT

When the oven door is closed, the contacts COM - NC of the monitored switch must be open.
When the microwave oven is plugged in a wall outlet (230V / 50Hz), the line voltage is supplied to the noise filter.

(Figure O-1)

1. The control unit is not energized. The display shows nothing (Fig. O-1 (a)).
2. Open the door. The contacts (COM-NC) of the monitored latch switch are closed and the control unit is energized. Then contacts of relays RY1 and RY5 are closed, and the oven lamp will light and the display will show "SELECT LANGUAGE" in 5 languages. (Fig. O-1(b)).

NOTE: Once the language is selected using the LANGUAGE key, the display will show "ENERGY SAVE MODE TO GO OUT OF ENERGY SAVE MODE SET CLOCK" when the oven is plugged in.

3. Close the door. The contacts (COM-NC) of the monitored latch switch are opened and the contacts of relay RY1 are opened and the oven lamp will be turned off. The display will show " . 0". (Fig. O-1(c)).

NOTE: Energy save mode

1. If the oven has not been used for more than 3 minutes, the contacts of the relay RY5 will be opened and the control unit will be not energized. Open and close the door, the control unit will resume.
2. If the clock is set, this energy save mode does not work.
3. If the display shows different messages from **ENERGY SAVE MODE**, the oven may be set in demo mode. Close the door, see operation manual to cancel demo mode.

MICROWAVE COOKING CONDITION

HIGH COOKING

Enter a desired cooking time by touching the TIME keys and start the oven by touching START key.

Function sequence (Figure O-2)

CONNECTED COMPONENTS	RELAY
Oven lamp, Turntable motor	RY1
Power transformer	RY3
Fan motor	RY6

1. The line voltage is supplied to the primary winding of the high voltage transformer. The voltage is converted to about 3.3 volts A.C. output on the filament winding and high voltage of approximately 2000 volts A.C. on the secondary winding.
2. The filament winding voltage (3.3 volts) heats the magnetron filament and the high voltage (2000 volts) is sent to the voltage doubling circuit, where it is doubled to negative voltage of approximately 4000 volts D.C..
3. The 2450 MHz microwave energy produced in the magnetron generates a wavelength of 12.24 cm. This energy is channelled through the waveguide (transport channel) into the oven cavity, where the food is placed to be cooked.
4. When the cooking time is up, a single tone is heard and the relays RY1 + RY3 + RY6 go back to their home position. The circuits to the oven lamp, high voltage transformer, fan motor and turntable motor are cut off.
5. When the door is opened during a cook cycle, the switches come to the following condition.

SWITCH	CONTACT	CONDITION	
		DURING COOKING	DOOR OPEN (NO COOKING)
Monitored latch switch	COM-NO	Closed	Opened
	COM-NC	Opened	Closed
Stop switch	COM-NO	Closed	Open
Monitor switch	COM-NO	Closed	Opened
	COM-NC	Opened	Closed

The circuits to the high voltage transformer is cut off when the contacts of relay RY2, and the contacts (COM-NO) of the monitored latch switch SW1 and the monitor switch SW3 are made open. The circuit to the fan motor is cut off when the relay RY6 is made open.

OPERATION SEQUENCE

The circuit to the turntable motor is cut off when the contacts (COM-NO) of the monitored latch switch SW1 are made open. The oven lamp remains on even if the oven door is opened after the cooking cycle has been interrupted, because the relay RY1 stays closed. Shown in the display is the remaining time.

6. MONITOR SWITCH CIRCUIT

The monitor switch SW3 is mechanically controlled by oven door, and monitors the operation of the monitored latch switch SW1.

- 6-1 When the oven door is opened during or after the cycle of a cooking program, the monitored latch switch SW1, and stop switch SW2 must open their contacts (COM-NO) first. And the contacts (COM-NC) of the monitored latch switch SW1 are made closed. After that the contacts (COM - NC) of the monitor switch SW3 can be closed and the contacts (COM-NO) of monitor switch SW3 are made open.
- 6-2 When the oven door is closed, the contacts (COM - NC) of the monitor switch SW3 must be opened and the contacts (COM - NO) of monitor switch SW3 must be closed. After that the contacts (COM - NO) of the monitored latch switch SW1 and stop switch SW2 are made closed. And the contacts (COM - NC) of the monitored latch switch SW1 are made open .
- 6-3 When the oven door is opened and the contacts (COM - NO) of the monitored latch switch SW1 remain closed, the fuse F2 F8A will blow. Because the relay RY1 and monitor switch SW3 are closed and a short circuit is caused.

HIGH, MEDIUM HIGH, MEDIUM, MEDIUM LOW, LOW COOKING

When the microwave oven is preset for variable cooking power, the line voltage is supplied to the high voltage transformer intermittently within a 32-second time base through the relay contact which is coupled with the current-limiting relay RY2 . The following levels of microwave power are given.

NOTE: The ON/OFF time ratio does not exactly correspond to the percentage of microwave power, because approx. 3 seconds are needed for heating up the magnetron filament.

GRILL COOKING CONDITION

TOP GRILL (Figure O-3a)

In this condition the food is cooked by grill heating element energy. Programme the desired cooking time by turning the "TIME/WEIGHT" knob and the select knob to "GRILL". When the "START" button is pressed, the following operations occur:

1. The numbers on the digital read-out start the count down to zero.
2. The oven lamp, cooling fan motor and turntable motor are energized.
3. The relay RY3 is energized and the main supply voltage is applied to the top grill heating elements.
4. Now the food is cooked by the top grill heating elements.

NOTE: The grill cooking condition will be carried out continuously until the temperature of the oven cavity rise to 220°C.

CONVECTION COOKING CONDITION (Figure O-4)

PRE-HEATING (by 40°C - 130°C)

Turn select knob to CONVECTION.

Programme the desired convection temperature of 40°C - 130°C by pressing the CONVECTION button. When the START button is pressed, the following operations occur:

1. The relays RY1, RY6 and RY7 are energized, the oven lamp, turntable motor, fan motor and convection motor are turned on.
2. The relay RY4 is energized and the main supply voltage is applied to the convection heating element.
3. After the temperature of oven cavity rises to the selected one, the oven will continue to turn the convection heating element on and off to maintain the temperature for 30 minutes.

OPERATION SEQUENCE

PRE-HEATING (by 160°C - 250°C)

Turn select knob to CONVECTION

Programme the desired convection temperature of 160°C - 250°C by pressing the CONVECTION button.

When the START button is pressed, the following operations occur:

1. The relays RY1, RY6 and RY7 are energized, the oven lamp, turntable motor, fan motor and convection motor are turned on.
2. The relay RY4 and RY3 are energized and the main supply voltage is applied to the convection heating element and the grill heating elements.
3. After the temperature of oven cavity rises to the selected one, the oven will continue to turn the convection heating element on and off to maintain the temperature for 30 minutes. And simultaneously the grill heating element will be operated at 10% power output.

CONVECTION COOKING (by 250°C)

Programme the cooking time by turning the timer vari knob. And then programme the convection temperature of 250°C by pressing the CONVECTION button. When the START button is pressed, the following operations occur:

1. The relays RY1, RY6 and RY7 are energized, the oven lamp, turntable motor, fan motor and convection motor are turned on.
2. The relay RY4 and RY3 are energized and the main supply voltage is applied to the convection heating element and the grill heating elements.
3. The oven will continue to turn the convection heating element on and off to maintain the temperature for the programmed cooking time. And simultaneously the grill heating elements will be operated at 10% power output.

CONVECTION COOKING (by 40°C - 230°C)

Programme the cooking time by turning the timer vari knob. And then programme the desired convection temperature of 40°C - 230°C by pressing the CONVECTION button. When the START button is pressed, the following operations occur:

1. The relays RY1, RY6 and RY7 are energized, the oven lamp, turntable motor, fan motor and convection motor are turned on.
2. The relay RY4 is energized and the main supply voltage is applied to the convection heating element.
3. The oven will continue to turn the convection heating element on and off to maintain the temperature for the programmed cooking time.

DUAL COOKING CONDITION

MICROWAVE AND CONVECTION (Figure O-5a)

Programme the desired cooking time by turning the select knob to MICROWAVE and CONVECTION. Select the microwave power level by pressing the MICROWAVE POWER LEVEL button. And select the convection temperature by pressing the CONVECTION button.

NOTE: The 100% microwave power level can not be selected.

When the + 1min  / START button is pressed, the following operations occur:

1. The numbers on the digital read-out start the count down to zero.
2. The oven lamp, fan motor, turntable motor and convection motor are energized.
3. The relay RY4 will be energized and the main supply voltage is applied to the convection heating element.
4. The relay RY2 is energized and the microwave energy is generated by magnetron.
5. Now, the food is cooked by microwave and convection energy simultaneously.

MICROWAVE AND TOP GRILL (Figure O-5b)

Programme the desired cooking time by turning the select knob to MICROWAVE and TOP GRILL. Select the microwave power level by pressing the MICROWAVE POWER LEVEL button. When the START button is pressed, the following operations occur:

1. The numbers on the digital read-out start the count down to zero.
2. The oven lamp, fan motor and turntable motor are energized.
3. The relay RY3 is energized and the main supply voltage is applied to the top grill heating elements.
4. The relay RY2 is energized and the microwave energy is generated by magnetron.
5. Now the food is cooked by microwave and grill simultaneously.

OPERATION SEQUENCE

ON/OFF TIME RATIO

In dual cooking, the magnetron operate within a 48 second time base. The following table is the ON / OFF time ratio at each power output of the magnetron.

POWER OUTPUT	ON TIME	OFF TIME
100%	48 sec.	0 sec.
70%	36 sec.	12 sec.
50%	26 sec.	22 sec.
30%	16 sec.	32 sec.
10%	8 sec.	40 sec.

AUTOMATIC COOKING

Automatic cooking functions automatically work out the correct cooking mode and cooking time and/or cooking temperature. They will cook according to the special cooking sequence.

POWER OUTPUT REDUCTION

After the same cooking mode is carried out for more than the basis cooking time, the power output is automatically reduced by turning the control relays on and off intermittently, as shown in the table below. This is to protect the oven door against temperature rising.

Cooking mode	Basis cooking time (minutes)	Reduced power Output (1%)	Time base (seconds)
Microwave (100%)	20	70	32
Grill	15	70	48
Convection	No reduction		
D + Grill	40 (Micro.)	50	48
	15 (Grill)	50	48
U + Grill	15 (Micro.)	50	48
	15 (Grill)	50	48
L + Conv.	40 (Micro.)	50	48
	No reduction		

NOTE:

1. If the multiple sequence cooking is carried out in same mode, the basis cooking time is calculated from the first.
2. Even if the cooking is stopped by the STOP button or opening the door, the basis cooking time is calculated from the first.
3. If the same cooking mode is repeated within 1 and 15 seconds, the basis cooking time is calculated from the first.
4. If the same menu of Automatic Cooking is repeated within 1 minute and 15 seconds, the power output of the microwave or the grill will be reduced to 70% after 20 minutes when the oven is started at first.

FAN MOTOR OPERATION (in Grill, Convection and Dual mode)

When oven is stopped during cooking, or after the cooking is completed, the fan motor will operate if the oven cavity temperature is above 120°C, and the fan motor will stop if the oven cavity temperature is below 105°C.

CONVECTION MOTOR OPERATION

If the temperature of oven cavity is higher than 120°C after and when operated by 250°C convection cooking, 250°C dual convection cooking or 250°C preheating, the convection motor will operate for maximum 1 minute until the oven cavity temperature drops below 105°C.

FUNCTION OF IMPORTANT COMPONENTS

DOOR OPEN MECHANISM

The door can be opened by pulling the door handle.

Figure D-1. Door Open Mechanism

MONITORED LATCH SWITCH SW1

1. When the oven door is closed, the contacts (COM-NO) of the switch must be closed. And the contacts (COM-NC) must be opened.
2. When the oven door is opened, the contacts (COM-NO) of the switch must be opened. And the contacts (COM-NC) must be closed.

STOP SWITCH SW2

1. When the oven door is closed, the contacts (COM-NO) of the switch must be closed.
2. When the oven door is opened, the contacts (COM-NO) of switch must be opened.

MONITOR SWITCH SW3

The monitor switch is activated (the contacts opened) by the lower latch head on the door while the door is closed.

The switch is intended to render the oven inoperative by means of blowing the fuse F2 F8A when the contacts of the monitored latch switch SW1 fail to open when the door is opened.

Function

1. When the door is opened, the contacts (COM-NC) of monitor switch SW3 close (to the ON condition) due to their being normally closed and contacts (COM-NO) open. At this time the contacts (COM-NO) of monitored latch switch SW1 is in the OFF condition (contacts open) due to their being normally open contact switches.
2. As the door goes to a closed position, the monitor switch SW3 contacts (COM-NC) are opened and contacts (COM-NO) closed and then contacts (COM-NO) of monitored latch switch SW1 and stop switch SW2 are closed. (On opening the door, each of these switches operate inversely.)

3. If the door is opened and the monitored latch switch SW1 contacts (COM-NO) fail to open, the fuse F2 F8A blows immediately after closing of the monitor switch SW3 (COM-NC) contacts.

CAUTION: BEFORE REPLACING A BLOWN FUSE SWITCH SW3 FOR PROPER OPERATION. (REFER TO CHAPTER "TEST PROCEDURE").

FUSE F1 20A 250V

If the wire harness or electrical components are shortcircuited, this fuse F1 20A blows to prevent an electric shock or fire hazard.

FUSE F2 F8A 250V

1. If the wire harness or electrical components are shortcircuited, this fuse blows to prevent an electric shock or fire hazard.
2. The fuse also blows when the monitored latch switch SW1 remains closed with the oven door open and when the monitor switch SW3 contact (COM-NC) closes.
3. The fuse also blows when the asymmetric rectifier, H.V. rectifier, H.V. wire harness, H.V. capacitor, magnetron or secondary winding of high voltage transformer is shorted.

TC TRANSFORMER

T/C transformer converts A.C. line voltage into low voltage to drive the control unit.

THERMAL CUT-OUT TC1 125°C (MG)

This thermal cut-out protects the magnetron against overheat. If the temperature goes up higher than 125°C because the fan motor is interrupted or the ventilation openings are blocked, the thermal cut-out TC1 will open and switch off all the electrical parts. The defective thermal cut-out must be replaced with a new one.

THERMAL CUT-OUT TC2 170°C (GRILL)

This thermal cut-out protects the oven against the overheat during grill cooking, convection cooking or dual cooking. If the temperature rises above 170°C because the fan motor is interrupted, the air inlet duct is blocked or the ventilation openings are obstructed, the thermal cut-out TC2 opens and switches off all the electrical parts. When the cut-out cools itself down to the operating temperature of 155°C, the contacts of the thermal cut-out will close again.

FUNCTION OF IMPORTANT COMPONENTS

THERMAL CUT-OUT TC3 170°C (CONV.)

This thermal cut-out protects the convection motor against overheating. If the temperature of the thermal cut-out TC3 rises above 170°C because the convection fan is interrupted, the ventilation openings are obstructed or the other abnormal matter occurs, the thermal cut-out opens and switches off the convection heating element and the other electrical parts. When the cut-out cools itself down to the operating temperature of 155°C, the contacts of the thermal cut-out will close again.

ASYMMETRIC RECTIFIER

The asymmetric rectifier is solid state device that prevents current flow in both directions. And it prevents the temperature rise of the high voltage transformer by blowing the fuse F2 F8A when the high voltage rectifier is shorted.

The rated peak reverse voltage of D1 of the asymmetric rectifier is 6 KV. The rated peak reverse voltage of D2 of the asymmetric rectifier is 1.7 KV. D1 and D2 of the asymmetric rectifier or high voltage rectifier are shorted when the each peak reverse voltage goes beyond the each rated peak reverse voltage. (The process of the blowing the fuse F2 F8A.)

1. The high voltage rectifier is shorted by some fault when microwave cooking or dual cooking.
2. The peak reverse voltage of D2 of the rectifier goes beyond the rated peak reverse voltage 1.7 KV in the voltage doubler circuit.
3. D2 of the rectifier is shorted.
4. The large electric currents flow through the high voltage winding of the high voltage transformer.
5. The large electric currents beyond 8A flow through the primary winding of the high voltage transformer.
6. The fuse F2 F8A blows by the large electric currents.
7. The power supplying to the high voltage transformer is cut off.

NOISE FILTER

The noise filter assembly prevents radio frequency interference that might flow back in the power circuit.

TURNTABLE MOTOR TTM

The turntable motor rotates the turntable.

FAN MOTOR FM

The fan motor drives a blade which draws external cool air. This cool air is directed through the air vanes surrounding the magnetron and cools the magnetron. This air is channelled through the oven cavity to remove steam and vapours given off from heating food. It is then exhausted through the exhausting air vents of the oven cavity.

CONVECTION MOTOR CM

The convection motor drives the convection fan and provide the heated air.

GRILL HEATING ELEMENT GH

The grill heating elements are provided to brown the food and are located on the top of the oven cavity.

CONVECTION HEATING ELEMENT CH

The convection heating element situated at the rear of the oven cavity. It is intended to heat air driven by the convection fan. The heated air is kept in the oven and force-circulated and reheated by the convection heating element.

CONVECTION COOKING SYSTEM

This oven is designed with a hot air heating system where food is heated by forced circulation of the hot air produced by the convection heater. The air heated by the convection heating element is circulated through the convection passage provided on the outer casing of the oven cavity by means of the convection fan which is driven by the convection motor. It is then enters the inside of the oven through the vent holes provided on the back side of the oven. Next, the hot air heats the food on the turntable and leaves the oven cavity through the vent in the oven cavity rear wall.

In this way, the hot air circulates inside the oven cavity to raise its temperature and, at the same time, comes into contact with the food being cooked. When the temperature inside the oven cavity reaches the selected temperature, the heating elements are de-energized. When the temperature inside the oven cavity drops below the selected temperature, the heating elements are energized again. In this way, the inside of the oven cavity is maintained at approximately the selected temperature. When the convection time reaches "0", the heating elements are de-energized and the convection fan stops operating and the oven shuts off. At that time if the cavity air temperature has risen above 120°C, the fan motor remains rotating. Automatically the fan motor will be shut down at low temperature (less than 105°C).

FUNCTION OF IMPORTANT COMPONENTS

HDC01694.JPG

Figure D-2. Convection Cooking System

FIRE SENSING FEATURE

The oven will stop its operation when there is a fire in the oven cavity in microwave cooking condition. LSI measures the voltage across the temperature measurement circuit intermittently within 32-seconds time base since the oven is started in microwave cooking condition. The oven will stop its operation when the difference of the voltage is more than 0.39 volts in microwave cooking condition.

1. Within a 32-seconds base, the thermistor is energized for 2 seconds. At that time, the voltage across the temperature measurement circuit is measured.
2. The oven carries out the procedure above again. If the second voltage is 0.39V higher than first voltage, LSI judges it is a fire in the oven cavity and stop the oven.
3. When LSI judges it is a fire in the oven cavity, LSI will switch off the relays to high voltage transformer and fan motor and LSI stops counting down.

OPEN JUDGE BY THERMISTOR

1. If the temperature of the thermistor does not rise to more than 40°C after 4 minutes and 15 seconds from when the oven is started in convection, grill or dual cooking mode, the oven is turned off.
2. When the thermistor or the wire harness to the thermistor is opened, the oven is turned off after 4 minutes and 15 seconds because this condition is same as above.

HDC01695.JPG

DAMPER OPEN-CLOSE MECHANISM

Damper position is set automatically by damper motor DM, damper switch and motor cam.

These components are operated by a signal that judges if microwave cooking or convection cooking operation is selected by the CPU unit.

Microwave Cooking:

Damper is in the open position, because a portion of cooling air is channelled through the cavity to remove steam and vapours given off from the heating foods. It is then exhausted at the top of the oven cavity into a condensation compartment.

Convection Cooking:

Damper is in the closed position, so that no hot air will be allowed to leak out the oven cavity.

Damper Operation

1. When power supply cord is plugged in or when the control unit resumes after energy save mode finishes:
 - 1-1. When power supply cord is plugged in, a signal is sensed in the control unit, and operates shut-off relay (RY8).
 - 1-2. Contacts of shut-off relay (RY8) close, the damper motor DM is energized, opening the damper door.
 - 1-3. When the damper is moved to the open position by the damper cam, damper switch SW4 is closed (ON position).
 - 1-4. The signal of damper switch SW4 is re-sensed in the control unit and shut-off relay (RY8) is turned off.
 - 1-5. The rated voltage to the damper motor DM is stopped and the motor turns off.
2. When oven is microwave cooking: Damper is in the open position
3. When oven is convection cooking:
 - 3-1. Damper motor DM is energized right after the oven is started.
 - 3-2. When damper is in the closed position (damper switch SW4 is OFF), its signal is sensed by the control unit, and shut-off relay (RY8) is de-energized.
 - 3-3. The damper is held in the closed position during the convection cooking operation.
 - 3-4. At the end of the convection cooking, when the fan motor FM stops, shut-off relay (RY8) is energized, and the damper is returned to the open position.

NOTE: If the damper door is not in the proper position, closed during convection, grill or dual, or open during microwave, the control unit will stop oven operation after 1 minute.

FUNCTION OF IMPORTANT COMPONENTS

4. Operation of damper is shown below.

Cooking Mode	Operation of Damper
Microwave cooking	Open
Convection cooking	Closed
Grill; during backed up with Convection heating element	Closed
Grill; after convection heating element backed up has stopped	Open
Dual (Microwave and Convection)	Closed
Dual (Microwave and Grill)	Open
Fire sensing condition	Closed

TROUBLESHOOTING GUIDE

When troubleshooting the microwave oven, it is helpful to follow the Sequence of Operation in performing the checks. Many of the possible causes of trouble will require that a specific test be performed. These tests are given a procedure letter which will be found in the "Test Procedure" section.

IMPORTANT: If the oven becomes inoperative because of a blown fuse F2 (F8A) in the monitored latch switch SW1 – monitor switch SW3 circuit, check the monitored latch switch SW1 and monitor switch SW3 before replacing the fuse F2 (F8A).

TEST PROCEDURES

PROCEDURE LETTER

COMPONENT TEST

A MAGNETRON TEST

NEVER TOUCH ANY PART IN THE CIRCUIT WITH YOUR HAND OR AN INSULATED TOOL WHILE THE OVEN IS IN OPERATION.

CARRY OUT 3D CHECK

Isolate the magnetron from high voltage circuit by removing all leads connected to the filament terminal.

To test for an open circuit filament use an ohmmeter to make a continuity test between the magnetron filament terminals, the meter should show a reading of less than 1 ohm.

To test for a short circuit filament to anode condition, connect ohmmeter between one of the filament terminals and the case of the magnetron (ground). This test should be indicated an infinite resistance. If a low or zero resistance reading is obtained then the magnetron should be replaced.

MICROWAVE OUTPUT POWER (IEC-60705-1988)

The following test procedure should be carried out with the microwave oven in a fully assembled condition (outer case fitted). Microwave output power from the magnetron can be measured by way of IEC 60705, i.e. it is measured by how much power the water load can absorb. To measure the microwave output power in the microwave oven, the relation of calorie and watt is used. When P(W) heating works for t(second), approximately $P \times t / 4.187$ calorie is generated. On the other hand, if the temperature of the water with V(ml) rises ΔT ($^{\circ}\text{C}$) during this microwave heating period, the calorie of the water is $V \times \Delta T$.

The formula is as follows;

$$P \times t / 4.187 = V \times \Delta T + 0.55 \times mc (T2-T0)$$

$$P (W) = 4.187 \times V \times \Delta T / t$$

Our condition for water load is as follows:

Room temperature.....around 20 $^{\circ}\text{C}$

Water load.....1000 g

Heating time.....47 sec.

T2.....Final Temperature

Power supply Voltage.....Rated voltage

Initial temperature(T1).....10 \pm 1 $^{\circ}\text{C}$

Mass of container (mc).....330 g

$$P = 90 \times \Delta T + 0.55 \times mc (T2-T0) / 47$$

Measuring condition:

1. Container

The water container must be a cylindrical borosilicate glass vessel having a maximum material thickness of 3 mm and an outside diameter of approximately 190 mm.

2. Temperature of the oven and vessel.

The oven and the empty vessel are at ambient temperature prior to the start of the test.

3. Temperature of the water

The initial temperature of the water is (10 \pm 2) $^{\circ}\text{C}$.

4. Select the initial and final water temperature so that the maximum difference between the final water temperature and the ambient temperature is 5K.

5. Select stirring devices and measuring instruments in order to minimize addition or removal of heat.

6. The graduation of the thermometer must be scaled by 0.1 $^{\circ}\text{C}$ at minimum and an accurate thermometer.

7. The water load must be (1000 \pm 5) g.

8. "t" is measured while the microwave generator is operating at full power. Magnetron filament heat-up time is not included.

NOTE: The operation time of the microwave ovens is "t + 3" sec. (3 sec. is magnetron filament heat-up time.)

TEST PROCEDURES

PROCEDURE LETTER	COMPONENT TEST
------------------	----------------

- Measuring method:
1. Measure the initial temperature of the water before the water is added to the vessel. (Example: The initial temperature $T_1 = 11^\circ\text{C}$)
 2. Add the 1 litre water to the vessel.
 3. Place the load on the centre of the shelf.
 4. Operate the microwave oven at HIGH for the temperature of the water rises by a value ΔT of (10 ± 2) K.
 5. Stir the water to equalize temperature throughout the vessel.
 6. Measure the final water temperature. (Example: The final temperature $T_2 = 21^\circ\text{C}$)
 7. Calculate the microwave power output P in watts from above formula.

Room temperature	$T_0 = 21^\circ\text{C}$	Initial temperature.....	$T_1 = 11^\circ\text{C}$
Temperature after $(47 + 3) = 50$ sec.....			$T_2 = 21^\circ\text{C}$
Temperature difference Cold-Warm.....			$\Delta T_1 = 10^\circ\text{C}$
Measured output power			
The equation is " $P = 90 \times \Delta T$ "			$P = 90 \times 10^\circ\text{C} = 900\text{Watts}$

JUDGEMENT: The measured output power should be at least $\pm 15\%$ of the rated output power.

CAUTION: 1°C CORRESPONDS TO 90 WATTS. REPEAT MEASUREMENT IF THE POWER IS INSUFFICIENT.

B HIGH VOLTAGE TRANSFORMER TEST

WARNING: High voltages and large currents are present at the secondary winding and filament winding of the high voltage transformer. It is very dangerous to work near this part when the oven is on. NEVER make any voltage measurements of the high-voltage circuits, including the magnetron filament.

CARRY OUT 3D CHECKS

Disconnect the leads to the primary winding of the power transformer. Disconnect the filament and secondary winding connections from the rest of the HV circuitry. Using an ohmmeter, set on a range, it is possible to check the continuity of all three windings. The following readings should be obtained:-

- a. Primary windingapproximately 2Ω
- b. Secondary windingapproximately 127Ω
- c. Filament windingless than 1Ω

If the reading obtained are not as stated above, then the power transformer is probably faulty and should be replaced.

CARRY OUT 4R CHECKS

TEST PROCEDURES

PROCEDURE LETTER

COMPONENT TEST

C

HIGH VOLTAGE RECTIFIER TEST

CARRY OUT 3D CHECKS.

Isolate the high voltage rectifier assembly from the HV circuit. The high voltage rectifier can be tested using an ohmmeter set to its highest range. Connect the ohmmeter across the terminal B+C of the high voltage rectifier and note the reading obtained. Reverse the meter leads and note this second reading. The normal resistance is infinite in one direction and more than 100 k Ω in the other direction.

CARRY OUT 4R CHECKS

ASYMMETRIC RECTIFIER TEST

CARRY OUT 3D CHECKS.

HDC06669.JPG

Isolate the high voltage rectifier assembly from the HV circuit. The asymmetric rectifier can be tested using an ohmmeter set to its highest range across the terminals A+B of the asymmetric rectifier and note the reading obtained. Reverse the meter leads and note this second reading. If an open circuit is indicated in both direction then the asymmetric rectifier is good. If an asymmetric rectifier is shorted in either direction, then the asymmetric rectifier is probably faulty and must be replaced with high voltage asymmetric rectifier. When the asymmetric rectifier is defective, check whether magnetron, high voltage rectifier, high voltage wire or filament winding of the high voltage transformer is shorted.

CARRY OUT 4R CHECKS

NOTE: FOR MEASUREMENT OF THE RESISTANCE OF THE RECTIFIER, THE BATTERIES OF THE MEASURING INSTRUMENT MUST HAVE A VOLTAGE OF AT LEAST 6 VOLTS, BECAUSE OTHERWISE AN INFINITE RESISTANCE MIGHT BE SHOWN IN BOTH DIRECTIONS.

D

HIGH VOLTAGE CAPACITOR TEST

CARRY OUT 3D CHECKS

- A. Isolate the high voltage capacitor from the circuit.
 - B. Continuity check must be carried out with measuring instrument which is set to the highest resistance range.
 - C. A normal capacitor shows continuity for a short time (kick) and then a resistance of about 10 M Ω after it has been charged.
 - D. A short-circuited capacitor shows continuity all the time.
 - E. An open capacitor constantly shows a resistance about 10 M Ω because of its internal 10 M Ω resistance.
 - F. When the internal wire is opened in the high voltage capacitor, the capacitor shows an infinite resistance.
 - G. The resistance across all the terminals and the chassis must be infinite when the capacitor is normal.
- If incorrect reading are obtained, the high voltage capacitor must be replaced.

CARRY OUT 4R CHECKS

TEST PROCEDURES

PROCEDURE LETTER

COMPONENT TEST

E

SWITCH TEST

CARRY OUT 3D CHECKS.

Isolate the switch to be tested and using an ohmmeter check between the terminals as described in the following table.

Table: Terminal Connection of Switch

Plunger Operation	COM to NO	COM to NC
Released	Open circuit	Short circuit
Depressed	Short circuit	Open Circuit

COM; Common terminal

NO; Normally open terminal

NC; Normally close terminal

If incorrect readings are obtained, replace the switch.

CARRY OUT 4R CHECKS.

F

THERMISTOR TEST

CARRY OUT 3D CHECKS

Disconnect the connector B from CPU unit. Measure the resistance of the thermistor with an ohmmeter. Connect the ohmmeter leads to Pin No's C1 and C3 of the thermistor harness.

Room Temperature	Resistance
20°C - 30°C	Approximately 359.9 kΩ - 152 kΩ

If the meter does not indicate above resistance, replace the thermistor.

CARRY OUT 4R CHECKS

G

THERMAL CUT OUT TEST

CARRY OUT 3D CHECKS

Disconnect the leads from the terminals of the thermal cut-out. Then using an ohmmeter, make a continuity test across the two terminals as described in the below.

Table: Thermal Cut-out Test

Denominazione parte	Temperatura in condizione "ON" (circuito chiuso). (°C)	Temperatura in condizione "OFF" (circuito aperto). (°C)	Indication of ohmmeter (When room temperature is approx. 20°C.)
Interr. termico TC01 145°C	This is not reset able type	Above 125°C	Closed circuit
Interr. termico TC02 170°C	Below 155°C	Above 170°C	Closed circuit
Interr. termico TC03 170°C	Below 155°C	Above 170°C	Closed circuit

If incorrect readings are obtained, replace the thermal cut-out.

An open circuit thermal cut-out (MG) TC01 indicates that the magnetron has overheated, this may be due to restricted ventilation, cooling fan failure.

An open circuit thermal cut-out (GRILL) TC02 indicates that the oven cavity has overheated, this may be due to no load operation.

An open circuit thermal cut-out (CONV.) TC03 indicates that the convection fan winding has overheated, this may be due to restricted ventilation or locked cooling fan or locked convection fan motor.

CARRY OUT 4R CHECKS

TEST PROCEDURES

**PROCEDURE
LETTER**

COMPONENT TEST

H MOTOR WINDING TEST

CARRY OUT 3D CHECKS.

Disconnect the leads from the motor. Using an ohmmeter, check the resistance between the two terminals as described in the table below.

Table: Resistance of Motor

Motors	Resistance
Fan motor	Approximately 293 Ω
Turntable motor	Approximately 12.6 kΩ
Convection fan motor	Approximately 220 Ω
Damper motor	Approximately 11 kΩ

If incorrect readings are obtained, replace the motor.

CARRY OUT 4R CHECKS.

I NOISE FILTER TEST

CARRY OUT 3D CHECKS

Disconnect the leads from the terminals of the noise filter. Using an ohmmeter, check between the terminals as described in the following table.

L (min)	Cx ±20%	Cy ±20%	R1	R2
1.0mH	0.22µF	4700pF	10 MΩ	680kΩ

MEASURING POINTS	INDICATION OF OHMMETER
Between N and L	Approx. 680 kΩ
Between terminal N and WHITE	Short circuit
Between terminal L and RED	Short circuit

If incorrect readings are obtained, replace the noise filter unit.

CARRY OUT 4R CHECKS

J BLOWN FUSE F1 20A

CARRY OUT 3D CHECKS

If the fuse F1 20A is blown, there is a short or a ground in electrical parts or wire harness. Check them and replace the defective parts or repair the wire harness.

CARRY OUT 4R CHECKS

CAUTION: Only replace fuse F1 20A with the correct value replacement.

H BLOWN FUSE F2 F8A

CARRY OUT 3D CHECKS

1. If the fuse F2 F8A is blown when the door is opened, check the monitored latch switch SW1 and monitor switch SW3.
2. If the fuse F2 F8A is blown by incorrect door switching replace the defective switch(es) and the fuse F2 F8A.

TEST PROCEDURES

PROCEDURE LETTER

COMPONENT TEST

3. If the fuse F2 F8A is blown, there could be shorts in the asymmetric rectifier or there is a ground in wire harness. A short in the asymmetric rectifier may be occurred due to short or ground in H.V. rectifier, magnetron, high voltage transformer or H.V. wire. Check them and replace the defective parts or repair the wire harness.

CARRY OUT 4R CHECKS

CAUTION: Only replace fuse F2 F8A with the correct value replacement.

L

GRILL HEATING ELEMENT TEST (TOP) AND CONVECTION HEATING ELEMENT TEST

CARRY OUT 3D CHECKS

Before carrying out the following tests make sure the heating element is cooled completely.

1. Resistance of heating element.

Disconnect the wire leads to the heating element to be tested. Using ohmmeter with low resistance range. Check the resistance across the terminals of the heating element as described in the following table.

Table: Resistance of heating element

Part name	Resistance
Grill heating element <u>GH</u> (top)	Approximately 44.4 Ω (22.2 Ω x 2)
Convection heating element <u>CH</u>	Approximately 42.5 Ω

2. Insulation resistance.

Disconnect the wire leads to the heating element to be tested. check the insulation resistance between the element terminal and cavity using 500V - 100M Ω insulation tester. The insulation resistance should be more than 10 M Ω in the cold start.

If the results of above test 1 and/or 2 are out of above specifications, the heating element is probably faulty and should be replaced.

CARRY OUT 4R CHECKS

M

CONTROL PANEL ASSEMBLY TEST

The control panel consists of circuits including semiconductors such as LSI, ICs, etc. Therefore, unlike conventional microwave ovens, proper maintenance can not be performed with only a voltmeter and ohmmeter.

In this service manual, the control panel assembly is divided into two units, CPU unit and Power Unit, and troubleshooting by replacement is described according to the symptoms indicated.

1. Jog Switch Unit Note: Check Jog and Switch unit wire harness connection before replacement. The following symptoms indicate a defective Jog Switch unit. Replace the Jog Switch unit.
 - 1-1. Tact switch
 - a) When touching the buttons, a certain button produces no signal at all.
 - b) When touching the buttons, sometimes a button produces no signal.
 - 1-2. Potentiometer
 - a) When rotating the potentiometer, the cooking mode can not be selected.
 - 1-3. Encoder
 - a) When rotating the encoder, the cooking time or the weight of food can not be entered.

TEST PROCEDURES

PROCEDURE LETTER	COMPONENT TEST
2.	<p>Control Panel The following symptoms indicate a defective control unit. Before replace the control unit, perform the Jog and Switch unit test (Procedure N) to determine if control unit is faulty.</p> <p>2-1. In connection with buttons.</p> <p style="margin-left: 20px;">a) When touching the buttons, a certain group of buttons do not produce a signal. b) When touching the buttons, no buttons produce a signal.</p> <p>2-2. N

KEY AND JOG UNIT TEST

If the display fails to clear when the STOP pad is depressed, first verify the flat ribbon cable is marking good contact, verify that the door sensing switch (stop switch) operates properly; that is the contacts are closed when the door is closed and open when the door is open. If the door sensing switch (stop switch) is good, disconnect the flat ribbon cable that connects the key unit to the control unit and make sure the door sensing switch is closed (either close the door or short the door sensing switch connector). Use the Key unit matrix indicated on the control panel schematic and place a jumper wire between the pins that correspond to the STOP pad marking momentary contact. If the control unit responds by clearing with a beep the key unit is faulty and must be replaced. If the control unit does not respond, it is faulty and must be replaced. If a specific pad does not respond, the above method may be used (after clearing the control unit) to determine if the control unit or key pad is at fault.

PROCEDURES TO BE TAKEN WHEN THE FOIL PATTERN ON THE PRINTED WIRING BOARD (PWB) IS OPEN

To protect the electronic circuits, this model is provided with a fine foil pattern added to the input circuit on the PWB, this foil pattern acts as a fuse. If the foil pattern is open, follow the troubleshooting guide given below for repair.
 Problem: POWER ON, indicator does not light up.

CARRY OUT 3D CHECKS

STEPS	OCCURRENCE	CAUSE OR CORRECTION
1	The rated AC voltage is not present between Pin No. 1 - 3 of the 4 pin connector (E)	Check supply voltage and oven power cord.
2	The rated AC voltage is not present at primary side of low voltage transformer.	Low voltage transformer or secondary circuit defective. Check and repair.
3	Only pattern at "a" is broken.	*Insert jumper wire J1 and solder. (CARRY OUT 3D CHECKS BEFORE REPAIR)
4	Pattern at "a" and "b" are broken.	*Insert the coil code 5028 24 08-00/9 between "c" and "d" (J1). (CARRY OUT 3D CHECKS BEFORE REPAIR)

NOTE: *At the time of these repairs, make a visual inspection of the varistor for burning damage and examine the transformer with tester for the presence of layer short circuit (check primary coil resistance). If any abnormal condition is detected, replace the defective parts.

CARRY OUT 4D CHECKS

JOG CONTROL PANEL ASSEMBLY

OUTLINE OF JOG CONTROL PANEL

The jog control section consists of the following units:

- (1) Key Unit
- (2) Control Unit (The Control unit consists of Power unit and CPU unit.)

The principal functions of these units and signals communicated among them are explained below.

Key Unit

The key unit is composed of a matrix, signals generated in the LSI are sent to the key unit from P14, P15, P16 and P17.

When a key pad is touched, a signal is completed through the key unit and passed back to the LSI through P70, P71, P72 and P73 to perform the function that was requested.

Control Unit

Control unit consists of LSI, power source circuit, synchronizing signal circuit, ACL circuit, buzzer circuit, relay circuit, temperature measurement circuit, indicator circuit, absolute humidity sensor circuit and back light circuit.

1) LSI

This LSI controls the temperature measurement signal, absolute humidity sensor signal, key strobe signal, relay driving signal for oven function and indicator signal.

2) Power Source Circuit

This circuit generates voltage necessary in the control unit.

Symbol	Voltage	Application
VC	-5.2V	LSI(IC1)

3) Synchronizing Signal Circuit

The power source synchronizing signal is available in order to compose a basic standard time in the clock circuit. It accompanies a very small error because it works on commercial frequency.

4) ACL

A circuit to generate a signal which resets the LSI to the initial state when power is supplied.

5) Buzzer Circuit

The buzzer is responsive to signals from the LSI to emit audible sounds (key touch sound and completion sound).

6) Door Sensing Switch (Stop Switch)

A switch to "tell" the LSI if the door is open or closed.

7) Relay Circuit

To drive the magnetron, grill heating element, convection heating element, convection motor, fan motor, turntable motor, damper motor, touch control transformer and light the oven lamp.

8) Back Light Circuit

A circuit to drive the back light (Light emitting diodes LD10 - LD19).

9) Indicator Circuit

This circuit consists 40-segments and 16-common electrodes using a Liquid Crystal Display. The Liquid Crystal Display (LCD) is driven by LCD driver IC3.

10) Temperature Measurement Circuit : (OVEN THERMISTOR)

The temperature in the oven cavity is sensed by the thermistor. The variation of resistance according to sensed temperature is detected by the temperature measurement circuit and the result applied to LSI. The LSI uses this information to control the relay and display units.

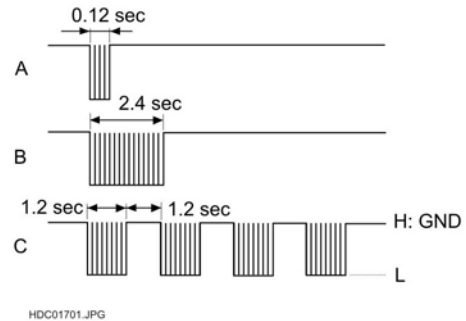

11) Damper Switch

A switch to tell the LSI if the damper is open or close.

SIGNALS AND TIMES FROM LSI

Signal to sound buzzer

- A: Tact switch touch sound.
- B: Completion sound.
- C: When the temperature of the oven cavity reaches the preset temperature in the preheating mode, or when the preheating hold time (30 minutes) is elapsed.

Magnetron high-voltage circuit driving signal.

To turn on and off the cook relay (RY2). In 100% operation, the signals hold "L" level during microwave cooking and "H" level while not cooking. In other cooking modes (70%, 50%, 30%, 10%) the signal turns to "H" level and "L" level in repetition according to the power level.

ON/OFF time ratio in Micro cooking
(a. 32second time base)

MICRO COOK	ON	OFF
100%	32 sec.	0 sec.
70%	24 sec.	8 sec.
50%	18 sec.	14 sec.
30%	12 sec.	20 sec.
10%	6 sec.	26 sec.

ON/OFF time ratio in Micro cooking
(a. 48second time base)

MICRO COOK	ON	OFF
100%	48 sec.	0 sec.
70%	36 sec.	12 sec.
50%	26 sec.	22 sec.
30%	16 sec.	32 sec.
10%	8 sec.	40 sec.

Grill (TOP) heating element driving signal.

To turn on and off the grill heating element relay (RY3). "L" level during grill cooking, convection cooking or dual cooking, "H" level otherwise. The heater relay turns on and off within a 48 second time base in accordance with the special program in LSI.

Power output	On time	OFF time
100%	48 sec.	0 sec.
90%	44 sec.	4 sec.
80%	40 sec.	8 sec.
70%	36 sec.	12 sec.
60%	32 sec.	16 sec.

SERVICING

1. Precautions for Handling Electronic Components

This unit uses CMOS LSI in the integral part of the circuits. When handling these parts, the following precautions should be strictly followed. CMOS LSI have extremely high impedance at its input and output terminals. For this reason, it is easily influenced by the surrounding high voltage power source, static electricity charge in clothes, etc. and sometimes it is not fully protected by the built-in protection circuit.

In order to protect CMOS LSI.

- 1) When storing and transporting, thoroughly wrap them in aluminium foil. Also wrap all PW boards containing them in aluminium foil.
- 2) When soldering, ground the technician as shown in the figure and use grounded soldering iron and work table.

2. Servicing of Touch Control Panel

We describe the procedures to permit servicing of the touch control panel of the microwave oven and the precautions you must take when doing so. To perform the servicing, power to the touch control panel is available either from the power line of the oven itself or from an external power source.

(1) Servicing the touch control panel with power line of the oven:

CAUTION:

THE HIGH VOLTAGE TRANSFORMER OF THE MICROWAVE OVEN IS STILL LIVE DURING SERVICING AND PRESENTS A HAZARD.

Therefore, before checking the performance of the touch control panel,

- 1) Disconnect the power supply cord, and then remove outer case.
- 2) Open the door and block it open.
- 3) Discharge high voltage capacitor.
- 4) Disconnect the leads to the primary of the power transformer.
- 5) Ensure that these leads remain isolated from other components and oven chassis by using insulation tape.
- 6) After that procedure, re-connect the power supply cord.

After checking the performance of the touch control panel,

- 1) Disconnect the power supply cord.
- 2) Open the door and block it open.
- 3) Re-connect the leads to the primary of the power transformer.
- 4) Re-install the outer case (cabinet).
- 5) Re-connect the power supply cord after the outer case is installed.

- 6) Run the oven and check all functions.

A. On some models, the power supply cord between the touch control panel and the oven itself is so short that the two can't be separated. For those models, check and repair all the controls (sensor-related ones included) of the touch control panel while keeping it connected to the oven.

B. On some models, the power supply cord between the touch control panel and the oven is long enough that they may be separated from each other. For those models, therefore, it is possible to check and repair the controls of the touch control panel while keeping it apart from the oven; in this case you must short both ends of the door sensing switch (on PWB) of the touch control panel with a jumper, which brings about an operational state that is equivalent to the oven door being closed. As for the sensor-related controls of the touch control panel, checking them is possible if the dummy resistor(s) with resistance equal to that of the controls are used.

(2) Servicing the touch control panel with power supply from an external power source:

Disconnect the touch control panel completely from the oven, and short both ends of the door sensing switch (SW3: STOP SWITC on PWB) of the touch control panel, which activates an operational state that is equivalent to the oven door being closed. Connect an external power source to the power input terminal of the touch control panel, then it is possible to check and repair the controls of the touch control panel.

3. Servicing Tools

Tools required to service the touch control panel assembly.

- 1) Soldering iron: 30W
(It is recommended to use a soldering iron with a grounding terminal.)
- 2) Others: Hand tools

4. Other Precautions

- 1) Before turning on the power source of the control unit, remove the aluminium foil applied for preventing static electricity.
- 2) Connect the connectors of the key unit to the control unit being sure that the lead wires are not twisted.
- 3) After aluminium foil is removed, be careful that abnormal voltage due to static electricity etc. is not applied to the input or output terminals.
- 4) Attach connectors, electrolytic capacitors, etc. to PWB, making sure that all connections are tight.
- 5) Be sure to use specified components where high precision is required.

COMPONENT REPLACEMENT AND ADJUSTMENT PROCEDURE

WARNING: Avoid possible exposure to microwave energy. Please follow the instructions below before operating the oven.

1. Disconnect oven from power supply.
2. Make sure that a definite "click" can be heard when the microwave oven door is unlatched. (Hold the door in a closed position with one hand, then push the open button with the other, this causes the latch heads to rise, it is then possible to hear a "click" as the door switches operate.)
3. Visually check the door and cavity face plate for damage (dents, cracks, signs of arcing etc.).
1. Door does not close firmly.
2. Door hinges, support or latch hook is damaged.
3. The door gasket or seal is damaged.
4. The door is bent or warped.
5. There are defective parts in the door interlock system.
6. There are defective parts in the microwave generating and transmission assembly.
7. There is visible damage to the oven.

Carry out any remedial work that is necessary before operating the oven.

Do not operate the oven if any of the following conditions exist;

Do not operate the oven:

1. Without the RF gasket (Magnetron).
2. If the wave guide or oven cavity are not intact.
3. If the door is not closed.
4. If the outer case (cabinet) is not fitted.

Please refer to 'OVEN PARTS, CABINET PARTS, CONTROL PANEL PARTS, DOOR PARTS', when carrying out any of the following removal procedures:

WARNING FOR WIRING

To prevent an electric shock, take the following these procedures.

1. Before wiring,
 - 1) Disconnect the power supply.
 - 2) Open the door and wedge the door open.
 - 3) Discharge the high voltage capacitor and wait for 60 seconds.
2. Don't let the wire leads touch to the following parts;
 - 1) High voltage parts:
Magnetron, High voltage transformer, High Voltage capacitor and High voltage rectifier assembly.
 - 2) Hot parts:
Grill heating element, Convection heating element, Oven lamp, Magnetron, High voltage transformer and Oven cavity.
 - 3) Sharp edge:
Bottom plate, Oven cavity, Weveguide flange, Chassis support and other metallic plate.
 - 4) Movable parts (to prevent a fault)
Fan blade, Fan motor, Switch, Turntable motor, Convection motor, convection fan and colling fan.
3. Do not catch the wire leads in the outer case cabinet.
4. Insert the positive lock connector certainly until its pin is locked. And make sure that the wire leads should not come off even if the wire leads is pulled.
5. To prevent an error function, connect the wire leads correctly, referring to the Pictorial Diagram.

BUILT IN FRAME ASSEMBLY REMOVAL

To remove the built in frame assembly, proceed as follows.

1. Remove the four screws securing the frame assembly to the oven cavity, (two from the top and two from the hinge side).
2. Remove the two screws securing the frame assembly to the control panel frame (accessed from the back of the frame).
3. Open the oven door fully.
4. Push down the built in frame assembly at the bottom, where it meets the cavity face.

5. Pull the built in frame assembly away from the cavity face
6. Now the built in frame assembly is free.

COMPONENT REPLACEMENT AND ADJUSTMENT PROCEDURE

OUTER CASE REMOVAL

To remove the outer case, proceed as follows.

1. Disconnect oven from power supply.
2. Open door and wedge it open.
3. Remove the one (1) screw holding the air duct to the oven cavity rear plate.
4. Remove the air duct.
5. Remove the nine (9) screws from rear and along the side edge of case.
6. Slide the entire case back about 3 cm to free it from retaining clips on the cavity face plate.

7. Lift the entire case from the oven.
8. Discharge the H.V capacitor before carrying any further work.
9. Do not operate the oven with the outer case removed.

N.B. : Step 1, 2 and 8 from the basis of the 3D checks.

CAUTION: DISCHARGE HIGH VOLTAGE CAPACITOR BEFORE TOUCHING ANY OVEN COMPONENTS OR WIRING.

HIGH VOLTAGE COMPONENTS REMOVAL (HIGH VOLTAGE CAPACITOR AND HIGH VOLTAGE RECTIFIER ASSEMBLY)

To remove the components, proceed as follows.

1. CARRY OUT 3D CHECKS
2. Disconnect the filament leads of the high voltage transformer and the high voltage wire of the high voltage capacitor.
3. Disconnect the high voltage wire B from the high voltage capacitor.
4. Remove one (1) screw holding earth side terminal of the high voltage rectifier assembly to the base plate through the capacitor holder.
5. Release the capacitor holder from the base plate.
6. Remove the high voltage capacitor from the capacitor holder.

7. Disconnect the high voltage rectifier assembly from the high voltage capacitor.
8. Now, the high voltage rectifier assembly and the high voltage capacitor should be free.

CAUTION: WHEN REPLACING HIGH VOLTAGE RECTIFIER ASSEMBLY, ENSURE THAT THE CATHODE (EARTH) CONNECTION IS SECURELY FIXED TO THE CAPACITOR HOLDER AND BASEPLATE WITH AN EARTHING SCREW.

HIGH VOLTAGE TRANSFORMER REMOVAL

1. CARRY OUT 3D CHECKS
2. Disconnect the main wire harness from the high voltage transformer.
3. Disconnect the filament leads and high voltage wire of high voltage transformer from high voltage capacitor and the magnetron.

4. Remove the two (2) screws and one (1) washer holding the transformer to the base plate.
5. Remove the transformer.
6. Now the high voltage transformer is free.

MAGNETRON REMOVAL

1. CARRY OUT 3D CHECKS.
2. Disconnect the H.V. wire B (part of H.V. transformer) and filament lead of the transformer from the magnetron.
3. Carefully remove three(3) screws holding the magnetron to the waveguide, when removing the screws hold the magnetron to prevent it from falling.
4. Remove the one (1) screw holding the magnetron to the chassis support.

5. Remove the magnetron from the waveguide with care so the magnetron antenna is not hit by any metal object around the antenna.
6. Now, the magnetron is free.

CAUTION: WHEN REPLACING THE MAGNETRON, BE SURE THE R.F. GASKET IS IN PLACE AND THE MAGNETRON MOUNTING SCREWS ARE TIGHTENED SECURELY.

COMPONENT REPLACEMENT AND ADJUSTMENT PROCEDURE

CONTROL PANEL ASSEMBLY REMOVAL

1. CARRY OUT 3D CHECKS.
2. Disconnect the main wire harness from the control panel.
3. Remove the one (1) screw holding the control panel to the oven cavity.
4. Lift the control panel assembly and pull it forward. Now, the control panel assembly is free.

FAN MOTOR REPLACEMENT

REMOVAL

1. CARRY OUT 3D CHECKS.
2. Remove the one (1) screw holding the noise filter to the chassis support.
3. Release the noise filter from the tabs of the fan duct.
4. Remove the three (3) screw holding the chassis support to the oven cavity front flange, back plate, and the magnetron.
5. Remove the chassis support from the oven cavity.
6. Disconnect the wire leads from the fan duct.
7. Remove the one (1) screw holding the fan duct to the back plate.
8. Release the tabs of the fan duct from back plate.
9. Remove the fan duct from the oven.
10. Remove the fan blade from the fan motor shaft according to the following procedure.
 - 1) Hold the edge of the rotor of the fan motor by using a pair of groove joint pliers.

CAUTION:

- Make sure that no swarf from the rotor enters the gap between the rotor & stator of the fan motor.
 - Avoid touch the coil of the fan motor with the pliers as the coil may become cut or damaged.
 - Avoid deforming the bracket whilst using the pliers.
- 2) Remove the fan blade assembly from the shaft of the fan motor by pulling and rotating the fan blade with your hand.
 - 3) Now, the fan blade is free.

CAUTION:

- Do not re-use the removed fan blade as the fixing hole may be oversized.

11. Remove the two (2) screws holding the fan motor to the fan duct.
12. Now, the fan motor is free.

INSTALLATION

1. Install the the fan motor to the fan duct with the two (2) screws and nuts.
2. Install the fan blade to the fan motor shaft according to the following procedure.
 - 1) Hold the centre of the bracket which supports the shaft of the fan motor on a flat table.
 - 2) Apply the screw lock tight into the hole (for shaft) of the fan blade.
 - 3) Install the fan blade to the shaft of fan motor by pushing the fan blade with a small, light weight, ball peen hammer or rubber mallet.

CAUTION:

- Do not hit the fan blade when installing because the bracket may be deformed.
 - Make sure that the fan blade rotates smoothly after installation.
 - Make sure that the axis of the shaft is not slanted.
3. Insert the tabs of the fan duct to the back plate.
 4. Install the fan duct to the back plate with the one (1) screw.
 5. Re-install the chassis support to the oven cavity with the four (4) screws.
 6. Install the noise filter to the fan duct and the chassis support with the one (1) screw.
 7. Re-connect the wire leads to the fan motor.

COMPONENT REPLACEMENT AND ADJUSTMENT PROCEDURE

TURNTABLE MOTOR REPLACEMENT

REMOVAL

1. Disconnect the oven from the power supply.
2. Remove the turntable and roller stay from the oven cavity.
3. Turn the oven over.
4. Cut the three (3) bridges holding the turntable motor cover to the base plate with cutting pliers as shown in Figure C-1(a).

CAUTION: DO NOT DROP THE TURNTABLE MOTOR COVER INTO THE OVEN AFTER CUTTING THE BRIDGES. BECAUSE IT WILL DAMAGE THE WIRE LEADS OF THE MOTOR AND IT IS DIFFICULT TO REMOVE IT OUT OF THE OVEN.

5. Remove the turntable motor cover from the base plate.
6. Disconnect the wire leads from the turntable motor.

Figure C-1(a). Turntable motor cover removal

7. Remove the two (2) screws holding the turntable motor to the oven cavity back plate.
8. Remove the turntable motor from the turntable motor angle. Now, the turntable motor is free.

RE-INSTALL

1. Remove the any sharp edges on the turntable motor cover and the base plate with the cutting pliers.
2. Re-install turntable motor by locating shaft onto coupling to the oven cavity base plate with the two (2) screws.
3. Re-connect the wire leads to the turntable motor.
4. Insert the one (1) tab of the turntable motor cover into the slit of the base plate as shown in Figure C-1(b).
5. Re-install the turntable motor cover to the base plate with the screw (code 5028 63 98-00/8) as shown in Figure C-1(b).

Figure C-1(b). Turntable motor cover re-install

CONVECTION MOTOR AND CONVECTION HEATING ELEMENT REMOVAL

1. CARRY OUT 3D CHECKS.
Now, the outer case cabinet and the air duct should have been removed.
2. Remove the one (1) screw holding the earth wire of the power supply cord to the back plate.
3. Release the power supply cord from the back plate.
4. Remove the two (2) screws holding the rear barrier to the base plate.
5. Release the three (3) tabs of rear barrier from the base plate. And remove the rear barrier.
6. Remove the one (1) screw holding the back plate to the base plate.
7. Remove the one (1) screw holding the chassis support to the back plate.
8. Remove the one (1) screw holding the the back plate to the air intake duct.
9. Remove the two (2) screws holding the back plate to the convection duct.
10. Remove the back plate from the oven cavity.
11. Disconnect the wire leads from the convection heating elements, convection motor and thermal cut-out.
12. Remove the one (1) screw holding the convection duct to the oven cavity back plate from outside of the oven cavity.

13. Remove the seven (7) screws holding the convection duct to the oven cavity back plate from inside of the oven cavity.
14. Lift up the convection duct and release the three (3) tabs of the oven cavity back plate from the convection duct.
15. Now, the convection unit assembly is free.

CONVECTION HEATING ELEMENT REMOVAL

1. Remove the two (2) screws holding the convection heating element to the convection duct.
2. Remove the one (1) screw holding the convection heater angle to the convection duct.
3. Remove the one (1) screw holding the convection heater angle and the air separate angle D to the convection duct.
4. Remove the one (1) screw holding the convection heater angle A to the convection duct.
5. Remove the convection heating element from the convection duct.
6. Now, the convection heating element is free.

COMPONENT REPLACEMENT AND ADJUSTMENT PROCEDURE

CONVECTION MOTOR REMOVAL

1. Remove the one (1) nut and washer from the convection motor shaft.
2. Remove the convection fan from the convection motor shaft.
3. Remove the pipe from the convection motor shaft.
4. Remove the two (2) screws holding the convection motor angle to the convection duct.

5. Remove the cooling fan from the convection motor shaft.
6. Remove the two (2) screws holding the convection motor to the convection motor angle.
7. Remove the one (1) ring from the convection motor shaft.
8. Now, the convection motor is free.

POSITIVE LOCK® CONNECTOR REMOVAL

1. CARRY OUT 3D CHECKS.
2. Push the lever of positive lock® connector.
3. Pull down on the positive lock® connector.

CAUTION: WHEN YOU (SERVICE ENGINEERS) CONNECT THE POSITIVE LOCK® CONNECTORS TO THE TERMINALS, CONNECT THE POSITIVE LOCK® SO THAT THE LEVER FACES YOU (SERVICE ENGINEERS).

HDC01707.JPG
Figure C-2. Positive lock® connector.

OVEN LAMP SOCKET REMOVAL

1. CARRY OUT 3D CHECKS.
2. Remove the wire leads as Positive lock® connector removal above.
3. Lift up the oven lamp from its retaining clips by pushing the tab of the air intake duct.
4. Now, the oven lamp is free.

HDC01708.JPG
Figure C-3. Oven lamp.

POWER SUPPLY CORD REPLACEMENT

REMOVAL

1. CARRY OUT 3D CHECKS.
2. Remove the one (1) screw holding the green/yellow wire to the back plate.
3. Disconnect the leads of the power supply cord from the noise filter, referring to the Figure C-4(a).
4. Release the power supply cord from the rear cabinet.
5. Now, the power supply cord is free.

HDC01709.JPG
Figure C-4(a). Replacement of Power Supply Cord.

RE-INSTALL

1. Insert the moulding cord stopper of power supply cord into the square hole of the power angle, referring to the Figure C-4(b).
2. Install the earth wire lead of power supply cord to the back plate with one (1) screw and tight the screw.
3. Connect the brown and blue wire leads of power supply cord to the noise filter correctly, referring to the Pictorial Diagram.

HDC01710.JPG
Figure C-4(b). Power Supply Cord Replacement.

COMPONENT REPLACEMENT AND ADJUSTMENT PROCEDURE

GRILL HEATING ELEMENTS REMOVAL

1. CARRY OUT 3D CHECKS.
2. Disconnect wire leads from the thermal cut-out (GRILL).
3. Remove the two (2) screws holding the two (2) terminals of the main wire harness to the two (2) grill heating elements.
4. Remove the one (1) screw holding the exhaust duct to the oven cavity top plate.
5. Remove the exhaust duct from the oven cavity top plate.
6. By pushing the two (2) tabs holding the grill reflector to the oven cavity top plate, slide the grill reflector toward the magnetron. And then lift up the grill reflector and remove it.
7. Remove the one (1) screw holding the grill heater angle to the grill heater reflector.
8. Straighten the two (2) tabs of the grill heater angle and remove the grill heater angle from the grill reflector.
9. Remove the two (2) screws holding the earth plate to the two (2) grill heating elements.
10. Remove the two (2) grill heating elements from the grill reflector.
11. Now, the grill heating elements are free.

MONITORED LATCH SWITCH, MONITOR SWITCH AND STOP SWITCH REMOVAL

1. CARRY OUT 3D CHECKS.
2. Remove the control panel assembly referring to "CONTROL PANEL ASSEMBLY REMOVAL".
3. Disconnect the leads from all switches.
4. Remove the two (2) screws holding the latch hook to the oven cavity.
5. Remove the latch hook.
6. Remove the switch(es) from the latch hook by pushing the retaining tab backwards slightly and turning the switch(es) on the post.
7. Now the switch(es) is free.

Figure C-5. Switches

MONITORED LATCH SWITCH, STOP SWITCH AND MONITOR SWITCH ADJUSTMENT

If the monitored latch switch, stop switch and monitor switch do not operate properly due to a mis-adjustment, the following adjustment should be made.

1. CARRY OUT 3D CHECKS.
2. Loosen the two (2) screws holding the latch hook to the oven cavity front flange.
3. With the door closed, adjust the latch hook by moving it back and forward or up and down. In and out play of the door allowed by the latch hook should be less than 0.5 mm. The horizontal position of the latch hook should be placed where the monitor switch has activated with the door closed. The vertical position of the latch hook should be placed where the monitored latch switch and stop switch have activated with the door closed.
4. Secure the screws with washers firmly.
5. Make sure of the all switches operation. If the latch head has not pushed the plungers of the monitor switch with door closed, adjust the latch hook position. At that time, the latch head should have pushed the plungers of the monitored latch switch and stop switch. If the latch head has not pushed the plungers of the monitored latch switch and stop switch with door closed, loose two (2) screws holding latch hook to oven cavity front flange and adjust the latch hook position.
6. Then check the lower latch hook position, pushing and pulling lower portion of the door toward the oven face. Both results (play of the door) should be less than 0.5mm.
7. The contacts (COM-NO) of the stop switch and the monitored latch switch open within 1.8mm gap between right side of cavity face plate and door when door is opened.
8. When the door is closed, the contacts (COM-NO) of the stop switch close.
9. When the door is closed the contacts (COM-NC) of the monitor switch and monitored latch switch open. And the contacts (COM-NO) of their switches close.
10. Re-install outer case and check for microwave leakage around the door with an approved microwave survey meter. (Refer to Microwave Measurement Procedure.)

Figure C-6. Latch Switches Adjustment.

After adjustment, make sure of following:

1. In and out play of door remains less than 0.5 mm when latched position. First check the latch hook position, pushing and pulling upper portion of the door toward the oven face.

COMPONENT REPLACEMENT AND ADJUSTMENT PROCEDURE

DOOR REPLACEMENT

REMOVAL

1. Disconnect the oven from the power supply.
2. Push the door slightly.
3. Remove the door stopper from the choke cover.
4. Lift the door upwards.
5. Now, door assembly is free from oven cavity.
6. Insert an putty knife (thickness of about 0.5mm) into the gap between the choke cover and door frame as shown in Figure C-7 to free engaging parts.
8. Now choke cover is free.
9. Release choke cover from door panel.

HDC00684.JPG

Figure C-7. Door Disassembly.

DOOR PANEL

10. Remove the eight (8) screws holding the door panel to the door frame.
11. Now, door panel is free.

CAUTION: DO NOT DEFORM OR WARP THE TEETH OF COMB OF THE DOOR PANEL TO PREVENT MICROWAVE RADIATION EMISSION FROM THE DOOR LATCH HEAD AND SPRING

12. Slide latch head upward and remove it from door frame with releasing latch spring from door frame and latch head.
13. Now, latch head and latch spring are free.

DOOR HANDLE

14. Remove the two (2) screws holding the door handle to the door frame.
15. Remove the door handle from the door frame.

RE-INSTALL

1. Re-install the door handle to the door frame as follows.
 - a) Insert the door handle to the door frame.
 - b) Hold the door handle to the door frame with the two (2) screws.
2. Re-install the latch spring to the latch head. Re-install the latch spring to the door frame. Re-install latch head to door frame.
3. Re-install door panel to door frame.
4. Hold the door panel to the door frame with eight (8) screws.
5. Re-install choke cover to door panel by clipping into position.

6. Locate door panel hinge pins into cavity hinge location holes.
7. Re-install the door stopper to the chock cover.

Note: After any service to the door;

(A) Make sure that the monitor switch, monitored latch switch and stop switch are operating properly. (Refer to chapter "Test Procedures").

(B) An approved microwave survey meter should be used to assure compliance with proper microwave radiation emission limitation standards. (Refer to Microwave Measurement Procedure.)

After any service, make sure of the following :

1. Door latch heads smoothly catch latch hook through latch holes and that latch head goes through centre of latch hole.
2. Deviation of door alignment from horizontal line of cavity face plate is to be less than 1.0mm.
3. Door is positioned with its face pressed toward cavity face plate.
4. Check for microwave leakage around door with an approved microwave survey meter. (Refer to Microwave Measurement Procedure.)

Note: The door on a microwave oven is designed to act as an electronic seal preventing the leakage of microwave energy from oven cavity during cook cycle. This function does not require that door be air-tight, moisture (condensation)-tight or light-tight. Therefore, occasional appearance of moisture, light or sensing of gentle warm air movement around oven door is not abnormal and do not of themselves, indicate a leakage of microwave energy from oven cavity.

HDC01867.JPG

Figure C-8. Door Replacement

MICROWAVE MEASUREMENT

After adjustment of door latch switches, monitor switch and door are completed individually or collectively, the following leakage test must be performed with a survey instrument and it must be confirmed that the result meets the requirements of the performance standard for microwave oven.

REQUIREMENT

The safety switch must prevent microwave radiation emission in excess of 5mW/cm² at any point 5 cm or more from external surface of the oven.

PREPARATION FOR TESTING:

Before beginning the actual test for leakage, proceed as follows;

1. Make sure that the test instrument is operating normally as specified in its instruction booklet.
Important:
Survey instruments that comply with the requirement for instrumentations as prescribed by the performance standard for microwave ovens must be used for testing.

Recommended instruments are:

- NARDA 8100
- NARDA 8200
- HOLADAY HI 1500
- SIMPSON 380M

2. Place the oven tray into the oven cavity.
3. Place the load of 275 ± 15ml of water initially at 20 ± 5°C in the center of the oven tray. The water container should be a low form of 600 ml beaker with inside diameter of approx. 8.5cm and made of an electrically non-conductive material such as glass or plastic.

The placing of this standard load in the oven is important not only to protect the oven, but also to insure that any leakage is measured accurately.

4. Close the door and turn the oven ON with the timer set for several minutes. If the water begins to boil before the survey is completed, replace it with 275ml of cool water.
5. Move the probe slowly (not faster than 2.5cm/sec.) along the gap.
6. The microwave radiation emission should be measured at any point of 5cm or more from the external surface of the oven.

TEST DATA AT A GLANCE

Parts	Symbol	Value / Data
Fuse	F1	20A / 250V
Fuse	F2	F 8A
Thermal cut-out (OVEN)	TC1	125°C Off
Thermal cut-out (OVEN)	TC2, TC3	170°C Off / 155 °C On
Thermistor		Approx. 359.9 kΩ - 152 kΩ at 20°C - 30°C
Grill heating element	GH	Approx. 44.4 Ω (22.2 x 2) / Insulation resistance > 10 MΩ
Convection heating element	CH	Approx. 42.5 Ω / Insulation resistance > 10 MΩ
Oven lamp	OL	240-250V 25W
High voltage capacitor	C	1.16μF AC 2100V
Magnetron	MG	Filament < 1Ω / Filament – chassis ∞ ohm.
Power transformer	T	Filament winding < 1Ω Secondary winding Approx. 160 / Primary winding Approx. 2 Ω.

WARNING: DISCONNECT THE PLUG WHEN MEASURING RESISTANCE
